

Classwork

Design and implement a Flutter application that:

- Displays a scrollable list of Employee objects in a ListView, where each item shows the employee's avatar, name, and role.
- When the user taps on an employee in the list, navigates to a second screen that displays that employee's full details (photo, name, role, email, and phone).
- Part A: Create a screen that builds the list (ListView.builder + ListTile), including how you handle taps to navigate.
- Part B: Write the Dart code for the detail screen that receives an employee object and renders all of its fields.
- Part C (Bonus): Modify your implementation so that the detail screen can return a "favorite" flag back to the list screen, and update the list item's UI (e.g., show a star icon) based on that flag.

NOTE:

- Take input from user for all the fields
- Example screenshot
